

Contributions on Mathematical Software at ICM2006

The development of algorithms and mathematical software is an active research area that plays an important role in many fields of Mathematics, both theoretical and applied. Accordingly to this fact, *The International Congress of Mathematicians 2006 (ICM'06)* organizes, within its activities, a session devoted to Mathematical Software.

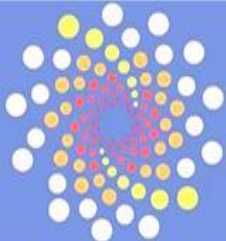

The main purpose of this conference activity is to give an overview of the state of the art of the current research and development of Mathematical Software. More precisely, its general aim is to present mathematical software systems or mathematical applications ranging from general purpose to more specialized systems, including implementations of specially designed algorithms solving particular mathematical problems of research interest.

If your research activity is related to this area, and you are interested in participating with a contribution at this session, please visit the following web page to get more information
